Examiner

Matthew J Kremer

Art Unit

3736

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☐ Responsive to communication(s) filed on ____.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-6,8-13,15-24,26-31,33-42 and 44-52 is/are pending in the application.
- 4a) Of the above claim(s) 7,14,25,32 and 43 is/are withdrawn from consideration.
- 5) ☐ Claim(s) ____ is/are allowed.
- 6) ☒ Claim(s) 1-6,8-13,15-24,26-31,33-42 and 44-52 is/are rejected.
- 7) ☐ Claim(s) ____ is/are objected to.
- 8) ☐ Claim(s) ____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on ____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on ____ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. ____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) ____.
- 4) ☐ Interview Summary (PTO-413) Paper No(s). ____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

DETAILED ACTION

Double Patenting

1. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

2. Claims 1-3, 8-13, 15-16, 19-21, 26-31, 33-34, 37-39, 44-46, and 49 are provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 13, 15, 33, and 35-36 of U.S. copending Application No. 09080470 to Khalil et al. in view of the journal publication "Effect of temperature on the optical properties of *ex vivo* human dermis and subdermis" by Laufer et al. (cited by Applicant). This is a provisional obviousness-type double patenting rejection. Claim 13 of Khalil et al. discloses a method of measuring one or more parameters of a body part by setting the body to one temperature (step a), taking an optical measurement of light which has been reflected, scattered, absorbed, or emitted (step b), determining an optical property (step c), setting the body to another temperature (step d), determining an optical property (step e), and analyzing the optical

Art Unit: 3736

properties to determine one parameter (step f). Khalil et al. does not disclose that the first temperature corresponds to a first depth in the body part and the second temperature corresponds to a second depth in the body part. Laufer et al. discloses on page 2488 that there is a decrease in the scattering coefficient for the subdermis and an increase for the dermis with temperature. It is implied that at different temperatures, different layers are being measured in relation to reflected measurements since the average sampling depth of the measurements is shifting. Functionally, the method of Khalil performs this operation since the fact that the average sampling depth in a tissue changes with temperature is a naturally occurring phenomenon. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the method of Khalil to include the fact that a temperature corresponds to the depth in a body part as disclosed by Laufer et al. since the fact that the average sampling depth in a tissue changes with temperature is a naturally occurring phenomenon. Claims 1-3, 11-12, 15-16, 19-21, 29-30, and 33-34 are rejected over claim 13 of Khalil et al. Claims 13 and 31 are rejected over claims 15 and 46-47 of Khalil et al. Claims 37-39, 46-47, and 49 are rejected over claim 33 of Khalil et al. Claim 44 is rejected over claim 35 of Khalil et al. Claim 45 is rejected over claim 36 of Khalil et al. In regard to claims 8 and 26, Laufer et al. performed the diffuse reflectance measurements at four different temperatures : 25, 30, 35, and 40 degree Celsius as stated on page 2479 of Laufer et al. In regard to claims 9-10 and 27-28, Laufer et al. shows in Figs. 2-3 that the wavelengths of interest are between 650 and 1000 nm.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-3, 6, 8-13, 15-21, 24, 26-31, 33-39, and 42, 44-51 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent 5,978,691 to Mills in view of the journal publication "Effect of temperature on the optical properties of *ex vivo* human dermis and subdermis" by Laufer et al. (cited by Applicant). Mills discloses a method and apparatus for monitoring blood parameters which makes use of measurements of the behavior of substances which are affected by temperature as stated column 1, lines 16-25. In column 9, lines 1-33, Mills teaches that to generate data, the temperature induction means is used to bring the finger (or tubing or other space of interest) to a known temperature, light of known wavelength and intensity is emitted on the surface of interest. Detection of the light signal at a distinct point (normally opposing surface) is made and the relative absorbance and extinction of the signal is calculated. The process is repeated at the next chosen wavelength, while still at the same predetermined temperature. Once the desired number of wavelengths has been examined, the temperature induction means would bring the volume to a predetermined second temperature, and the data collection of steps would be repeated. At the completion of measurements and determinations for this second temperature, the

Art Unit: 3736

temperature induction means will bring the space to a third predetermined temperature, and the measurements and determinations repeated. This process would be continued until the desired range of temperatures has been sampled. Mills does not disclose that the first temperature corresponds to a first depth in the body part and the second temperature corresponds to a second depth in the body part. Laufer et al. presents a study on the influence of temperature on the optical properties of human dermis and subdermis. Laufer et al. discloses on page 2488 that there is a decrease in the scattering coefficient for the subdermis and an increase for the dermis with temperature. This implies that at different temperatures, different layers are being measured in relation to reflected measurements since the average sampling depth of the measurements is shifting. Functionally, the method of Mills performs this operation since the fact that the average sampling depth in a tissue changes with temperature is a naturally occurring phenomenon. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the method of Mills to include the fact that a temperature corresponds to the depth in a body part as disclosed by Laufer et al. since the fact that the average sampling depth in a tissue changes with temperature is a naturally occurring phenomenon.

In regard to claims 3, 21, and 39, Mills teaches in column 8, lines 1-3 that reflectance spectrophotometry can be used. In regard to claims 8 and 26, Mills teaches that temperature of interest include 33 to 40 degree Celsius (column 13, lines 15-25 of Mills). In regard to claims 9-10, 27-28, and 44-45, Laufer et al. shows in Figs. 2-3 that

Art Unit: 3736

the wavelengths of interest are between 650 and 1000 nm and Mills indicates from Fig. 11 that 660 and 940 nm are of interest in oximetry in which these procedures can be used. In regard to claims 11-12, 29-30, and 46-47, Mills teaches that glucose and hemoglobin can be measured as stated in column 13, lines 31-35. In regard to claims 13, 31, and 48, Mills teaches that reflectance measurements may be employed (column 8, lines 1-3 of Mills) and Laufer et al. teaches on page 2479 that absorption coefficient and transport scattering coefficients were determined for the reflection measurements. In regard to claims 15-16, 33-34, and 49, Mills performs experiments on the finger as shown in Fig. 6 of Mills. In regard to claims 17-18, 35-36, and 50-51, Mills states in column 14, lines 11-25 that the invention can be used to determine sickle cell disease, certain cancers, and other diseases or conditions which are distinguished by markers in blood. In column 8, line 31, Mills teaches glucose can be measured which aids in determining diabetes.

5. Claims 4-5, 22-23, and 40-41 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent 5,978,691 to Mills in view of the journal publication "Effect of temperature on the optical properties of *ex vivo* human dermis and subdermis" by Laufer et al. (cited by Applicant) as applied to claims 1 and 19 in view of U.S. Patent 5,782,755 to Chance et al. (1998). The combination does not teach that the optical measurement is a spatially resolved diffuse reflectance measurement. Chance et al. (1998) discloses an invention which monitors one or more solutes in a biological system comprising the steps of: delivering light into a biological system containing one or more

solutes, detecting at least first and second portions of the delivered light, both portions having traveled through the biological system along one or more paths characterized by different path lengths, and comparing the first and second portions of the delivered light to monitor a concentration of one or more of the solutes in the biological system as stated in column 1, lines 45-62 of Chance et al. (1998). Column 3, lines 6-19 of Chance et al teaches that approximation of the exact solution for the spatially resolved reflectance at separations larger than 2.5 cm provides a linear relationship between the separation and absorbance variation with respect to a reference sample. Slope and intercept of this straight line are functions of the absorption and scattering coefficients of the measured sample. Using this technique, high measurement sensitivities for solute concentrations in a biological system can be achieved. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify combination to include spatially resolved reflectance as disclosed by Chance et al. (1998) since high measurement sensitivities for solute concentrations in a biological system can be achieved. In regard to claims 5, 23, and 41, Chance et al. (1998) states that frequency domain measurement can be employed as stated in column 20, lines 1-20.

6. Claim 52 is rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent 5,978,691 to Mills in view of the journal publication "Effect of temperature on the optical properties of *ex vivo* human dermis and subdermis" by Laufer et al. (cited by Applicant) as applied to claim 37 in view of U.S. Patent 5,873,821 to Chance et al.

(1999). The combination does not teach the use of an endoscope. Chance et al. (1999) discloses an oximeter that determines the oxygenation state of localized body tissue which includes at least a pair of spaced apart light sources and a pair of wave length-specific light detectors (e.g., photodetectors) as stated in column 3, lines 40-53. Each light source transmits specific wavelengths toward a tissue of interest and each detector receives photons of the respective specific wavelength that have originated from each light source and scattered from the localized tissue. Chance et al. (1999) further teaches that the oximeter can be disposed on an endoscope, catheter or guidewire or the like for insertion via a body passage to internal tissue as stated in column 6, lines 48-54. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify combination to include an endoscope as disclosed by Chance et al. (1999) since an endoscope would allow examination of internal tissue.

Response to Arguments

7. Examiner acknowledges Applicant's statement of deferral for submission of the terminal disclaimer due to the provisionally rejected claims based on co-pending application 09/080,470 to Khalil et al.

8. Applicant's arguments filed on 9/21/200 have been fully considered but they are not persuasive. In response to Applicant's argument that the method of Laufer et al. is used only with excised tissue, Laufer et al. discusses the importance of influences on

temperature on the optical properties of human tissues in the field of biomedical optics. (lines 1-2 of Introduction on p. 2479). Laufer et al. gives examples of the conditions of temperature variations such as hypothermia and skin in normal conditions. Laufer et al. further teaches that the optical properties of skin is particularly relevant during noninvasive examination of brain and muscle tissue as well as glucose. These teachings of Laufer et al. provide the motivation for the experiments which is to aid in the analysis of noninvasive procedures. Since the purpose of the experiments was to aid in noninvasive diagnostics then it is proper to use the information in noninvasive procedures. In response that Mills does not teach that the temperatures are not allowed to equilibrate, Mills teaches that to generate a single data point, the temperature induction means is used to bring the finger to a known temperature and the temperature measurement means will be used to confirm the temperature and adjust the temperature induction means if necessary. (column 9, lines 1-5 of Mills). In this procedure, there is a clear indication that there is a desired temperature to be achieved for measurement before the light emitter is used. The confirmation and correction procedure is used to establish the temperature of the finger. The inference that can be made is that there is a stable temperature within the finger; otherwise, the need to correct for a given temperature would be unnecessary if the temperature of the finger is in constantly changing. In response to the argument that Mills is unaware of the effect of temperature change upon the average sampling depth, the Examiner concedes this point; however, the information from Laufer et al. indicates that a temperature corresponds to the depth in a body part. Laufer et al. indicates that the average

sampling depth in a tissue changes with temperature is a naturally occurring phenomenon. Mills does not have to disclose this information since this phenomenon is inherent in its operation. In response to Applicant's comment that the combination of Mills and Laufer et al. is a piecemeal reconstruction of the prior art, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

Conclusion

7. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Matthew J Kremer whose telephone number is 703-605-

Art Unit: 3736

0421. The examiner can normally be reached on Mon. through Fri. between 7:30 a.m. - 4:00 p.m.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Eric Winakur can be reached on 703-308-3940. The fax phone numbers for the organization where this application or proceeding is assigned are 703-308-0758 for regular communications and 703-308-0758 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-308-0858.
